Dear Developer Success hiring team,

I am a full-stack engineer with twenty-five years in software, and for the past three years I have run a production application on Next.js and Vercel: the operational software for Fabulosa Books in San Francisco, covering staff scheduling, automated event promotion, and an in-house book-search engine backed by Postgres and the Anthropic stack. I am interested in the Developer Success Engineer role at Vercel because it maps directly to my current work: engaging with customers, understanding what they need, and building and shipping the solution.

Your listing calls for someone who can guide customers through onboarding and go-live, troubleshoot issues across Next.js, serverless functions, and build pipelines, and translate those engagements into documentation and playbooks. That is what I do on Vercel: I ship to the platform, diagnose what breaks, and document the fix so it does not recur. At Slack I wrote the API references, SDK guides, and platform tutorials that external developers built against, and I built internal Web API tooling adopted by those developers as official examples. As Technical Lead Manager for Platform QA, I owned quality across eight feature teams, including Block Kit and Workflows, partnering with product, engineering, and developer relations to unblock releases. My open-source work runs on the same stack as Vercel: MCP servers and Claude Code plugins, shipped in the open at ws-gong.com/code.

I have spent twenty-five years on one kind of problem: finding where a system fails, resolving it, and writing the account that keeps the next engineer from repeating it. I want to do that with Vercel's customers, turning each fix into documentation for the next customer to build on.

W.S. Gong
